Action Control From Cognition To

Aside from several nonpsychological factors capable of reducing cognition-behavior consistency, there seems to be a set of complex psychological mechanisms which intervene between action-related cognitions, such as beliefs, expectancies, values, and intentions, and the enactment of the behavior.

suggested by those cognitions.

Get this from a library! Action Control : From Cognition to Behavior. [Julius Kuhl; Jürgen Beckmann] -- "It is not thought as such that can move anything, but thought which is for the sake of something and is practical." This discerning insight,

which dates back more than 2000 years to Aristotle,
seems ...

From Intentions to Actions: A Theory of Planned Behavior ...

Our research focuses on the neurocognitive
mechanisms of eating behavior as well as how the
foods we consume impact our brain and cognition.

We study gut-brain communication as many Food & Cognition effects happen through the gut microbiome, immune system or peripheral markers of hunger and satiety. We are particularly interested in cognitive functions mediated by the dopamine system, such as ...

Action control, from cognition to behavior (Book, 1985 ...

Perception-action coupling. The idea of a continuity between the different aspects of motor cognition is not new. In fact, this idea can be traced to the work of the American psychologist William James and more recently, American neurophysiologist and Nobel prize winner Roger Sperry. Sperry argued that

the perception–action cycle is the fundamental logic of the nervous system.

Motor cognition - Wikipedia

COGNITION AND ACTIONS Research Team
Collaborations Publications RESEARCH Our
research mostly focuses on the neural correlates of
complex motor behavior in humans. Most daily life
situations require making decisions about actions.

The fluid and flexible manner with which we make such decisions indicates the operation of a selection process that takes into account multiple

Cognition - Wikipedia

This conceptualisation of control theory helps bridge the gap between cognition and action through hierarchically organised control loops. However, we note that top?down hierarchical control must be coupled with discrepancy?based bottom?up control for systems to survive or adjust

to changing environments.
