Asymptotic stability of linear and interval linear fractional-order neutral delay differential systems described by the Caputo-Fabrizio (CF) fractional derivatives is investigated. Using Laplace transform, a novel characteristic equation is derived. Stability criteria are established based on an algebraic approach and norm-based criteria are also presented.

SAP - A STRUCTURAL ANALYSIS PROGRAM FOR LINEAR SYSTEMS
Involving neither Fourier analysis nor Floquet factorizations, the VOCD models are linear discrete-time periodic, and essentially time-invariant; this paves a way to apply analysis and synthesis techniques for linear discrete-time systems to LCP ones. More specifically, stability criteria for LCP systems are developed with their VOCD counterparts.

Spectral Analysis of Linear Systems In this chapter the central theme is the decomposition of the abstract linear equation TX= y into sets of simple linear equations which can be solved independently. Our initial purpose for exploring this decomposition is to obtain conceptual simplification of the system model. It is easier to think

The numerical approximation of the μ -value is key towards the measurement of instability, stability analysis, robustness, and the performance of linear feedback systems in system theory. The MATLAB function mussv available in MATLAB Control Toolbox efficiently computes both lower and upper bounds of the μ -value. This article deals with the numerical approximations of the lower bounds of ...

Linear system analysis is concerned with the study of equilibrium and change in dynamical systems, that is, in systems that contain variables that may change with time. These variables include system inputs (external causes of change or excitation), outputs (measurable results or effects of the behavior, response, or dynamics of the system), as well as variables describing internal states of ...
