The piston ring is the one of the important component of the internal combustion engine. The primary function of piston ring in reciprocating engine is to seal the combustion chamber so that there is no transfer of gases from the combustion chamber of the crank. The auxiliary function is heat transfer from the piston to the cylinder wall.

Figure 13 shows a plot of cavity volume versus the downward displacement of the rigid body in Step 4 of the Abaqus/Standard analysis and Step 2 of the Abaqus/Explicit analysis. The cavity pressure and the cavity volume results from the static Abaqus/Standard analysis and the quasi-static Abaqus/Explicit analysis are virtually identical.
