Computational fluid dynamics is a branch of fluid mechanics that uses numerical analysis and data structures to analyze and solve problems that involve fluid flows. Computers are used to perform the calculations required to simulate the free-stream flow of the fluid, and the interaction of the fluid with surfaces defined by boundary conditions. With high-speed supercomputers, better solutions can be achieved, and are often required to solve the largest and most complex problems. Ongoing research

Computational fluid dynamics - Wikipedia

Computational Fluid Dynamics (CFD) has become a powerful method to fulfill such demands and is now widely being used to investigate the behavior of liquids, gases and floating objects. They can be computed in 3D, irrespective of their different sizes, combinations, or even their environments — man made or natural. DHI HAS THE SOLUTION
