The applications described are mainly in the areas of unmanned aerial vehicles (UAVs) and unmanned ground vehicles (UGVs).

Cooperative Control of Multi-Agent Systems: Optimal and ...
Cooperative Control of Multi-Agent Systems: A Consensus Region Approach offers a systematic framework for designing distributed controllers for multi-agent systems with general linear agent dynamics, linear agent dynamics with uncertainties, and Lipschitz nonlinear agent dynamics.

Cooperative Control of Multi-agent Systems - 1st Edition
Cooperative control of multi-agent systems is a challenging topic for both control theorists and practitioners and has been the subject of significant recent research. Cooperative Control of Multi-Agent Systems extends optimal control and adaptive control design methods to multi-agent systems on communication graphs. It develops Riccati design techniques for general linear dynamics for cooperative state feedback design, cooperative observer design, and cooperative dynamic output feedback design.

It develops Riccati design techniques for general linear dynamics for cooperative state feedback design, cooperative observer design, and cooperative dynamic output feedback design.

Cooperative Control of Multi-Agent Systems: A Consensus ...
The key objective of multi-agent cooperative control is to design a suitable control protocol or an algorithm by using only local interactions among the neighboring agents such that a coordinated task (or a collective behavior) of the overall MAS can be achieved.

Robust cooperative output regulation of multi-agent ...
The developed cooperative search framework is based on two inter- dependent tasks:(i) on-line learning of the environment and storing of the information in the form of a "search map"; and (ii) utilization of the search map and other information to compute on-line a guidance trajectory for the agent to follow.

Cooperative control of multi-agent systems to locate ...
Compared with anti-disturbance control in single systems, DCADC is more challenging because of the existence of coupling in multi-agent systems and the aim is to design distributed cooperative control based on the local information of each agent. This paper is concerned with some kinds of DCADC methods...

Cooperative Control of Multi-Agent Systems: A Consensus Region Approach provides a novel approach to designing distributed cooperative protocols for multi-agent systems with complex dynamics. The proposed consensus region decouples the design of the feedback gain matrices of the cooperative protocols from the communication graph and serves as a measure for the robustness of the protocols to variations of the communication graph.

The proposed control strategies need no global knowledge such as the minimal nonzero eigenvalue of the Laplacian matrix, and require much less data transmission. One possible future research can be directed to cooperative control of heterogeneous multi-agent systems with unknown linear systems, or even nonlinear agent dynamics.
