exist within any given population as a result of mutation, genetic recombination and other sources of genetic variation.

Evolution - Wikipedia

Natural selection is the differential survival and reproduction of individuals due to differences in phenotype. It is a key mechanism of evolution, the change in the heritable traits characteristic of a population over generations. Charles Darwin popularised the term "natural selection", contrasting it with artificial selection, which in his view is intentional, whereas natural selection is not.

William P. Cochlan, in Nitrogen in the Marine Environment (Second Edition), 2008. 3 Summary. A number of environmental factors exert a strong influence on the nitrogenous nutrition of Antarctic phytoplankton, and the evidence to date cannot demonstrate the dominance of one factor over another for the whole of the Southern Ocean.
