Solutions to Chen's Plasma Physics. 1-1. Compute the density (in units of m^{-3}) of an ideal gas under the following conditions: a) At 0 °C and 760 Torr pressure (1 Torr = 1mm Hg). This is called the Loschmidt number. b) In a vacuum at 10^{-3} Torr at room temperature (20 °C). This number is a useful one.

Show that a small displacement of a group of electrons leads to oscillations with the plasma frequency according to the equation (1.1). Solution The situation is sketched in the figure 1.1. Assume that the electric field in the plane perpendicular to the x-axis is zero (just like in the case of an infinitely large charged plane or capacitor).

(a) At standard temperature and pressure, a mole of an ideal gas contains 6.022×10^{23} molecules (Avogadro's number) and occupies 22.4 liters. Hence, the number per m^3 is $6.022 \times 10^{23} / 2.24 \times 10^{-2} = 2.66 \times 10^{25} m^{-3}$. (b) Since $PV = nRT$, $n = N/V = P/RT$. Hence $n_1/n_0 = P_1 T_0 / P_0 T_1$.
