I don't think so. Linear regression is nice, but it isn't a religion. You don't have to believe everything it says. The fit is not quite as tight for the women's times. Squaring  $-0.9199$  yields a coefficient of determination of  $0.8462$ . Thus a linear model only explains 85% of the variation in women's world record 100 m dash times.

9.2 Linear Regression If there is a "signi cant" linear correlation between two variables, the next step is to nd the equation of a line that "best" ts the data. Such an equation can be used for prediction: given a new  $x$ -value, this equation can predict the  $y$ -value that is consistent with the information known about the data.

Problem 1. (18 points.) Consider the linear regression model  $Y = X\beta + \epsilon$  with pre-determined (i.e., non-stochastic) regressors  $X$ . All of the usual assumptions hold except, instead of  $\text{Var}(\epsilon) = \sigma^2 I_n$ , we have  $\text{Var}(\epsilon) = E(\epsilon\epsilon') = \Sigma$ , where  $\Sigma$  is a generic symmetric positive definite matrix.

Linear regression analysis can then be used to establish whether a causal relationship between the independent and dependent variable exist. It is particularly useful to test observations made in experimental conditions such as this - here the oxygen level in the water might be deliberately manipulated to test the effects.

If you've ever taken a class in statistics before, linear regression is probably a familiar concept. This is no coincidence. At its core, machine learning is about taking in information and expanding on it, so it's natural that techniques from statistics play an important role in machine learning.
