1B.5: Graphs and Graphing - Chemistry LibreTexts

Solubility graphs represent the relationship between solubility (in grams of solid per volume of water) vs temperature. If the solution is above the solubility line it is supersaturated and below the solubility line it is unsaturated. Points along the line are points of saturation.

Factors Affecting Solubility | Boundless Chemistry

Considering the role of the solvent's chemical structure, note that the solubility of oxygen in the liquid hydrocarbon hexane, C<sub>6</sub>H<sub>14</sub>, is approximately 20 times greater than it is in water. Other factors also affect the solubility of a given substance in a given solvent.

Solubility Temperature Graphs Chapter 14

The solubility at 0°C is about 14 g, meaning that 80 - 14 = 66 g of the KNO<sub>3</sub> will recrystallize. Summary The solubility of a solid in water increases with an increase in temperature.

Solubility Versus Temperature: This chart shows the solubility of various substances in water at a variety of temperatures (in degrees Celsius). Notice how NaCl's solubility is relatively constant regardless of temperature, whereas Na<sub>2</sub>SO<sub>4</sub>'s solubility increases exponentially over 0-35 degrees Celsius and then abruptly begins to decrease.

Table  $\{\{1\}\}$ : Solubility of table salt as a function of water. In this graph 6 measurements of the solubility were made at different temperatures. Here, the solubility is the maximum amount of salt that can be dissolved in 100 grams of water, and any extra salt beyond that falls to the bottom of the container as a precipitate (solid).

Solubility and Temperature. Add varying amounts of a chemical to a beaker of water to create a solution, observe that the chemical dissolves in the water at first, and then measure the concentration of the solution at the saturation point. Either potassium nitrate or sodium chloride can be added to the water, and the temperature of the water ...
