Fall 2009 version of Course 15-359, Computer Science ...

Randomized algorithms are used when presented with a time or memory constraint, and an average case solution is an acceptable output. Due to the potential erroneous output of the algorithm, an algorithm known as amplification is used in order to boost the probability of correctness by sacrificing runtime. Amplification works by repeating the randomized algorithm several times with different random subsamples of the input, and comparing their results.

This document is an instructor's manual to accompany Introduction to Algorithms, Third Edition, by Thomas H. Cormen, Charles E. Leiserson, Ronald L. Rivest, and Clifford Stein. It is intended for use in a course on algorithms. You might also find some of the material herein to be useful for a CS 2-style course in data structures.
