document can be found in Appendix A. Some very simple sample data files are provided as plain text in Appendix B. This is a rather unconventional approach to providing example data and R code, but it has the advantage of providing the user with everything he or she needs to analyze wildlife telemetry data in a single document.

Based on the open source PostgreSQL/PostGIS spatial database, the software platform will allow researchers and managers to integrate and harmonize GPS tracking data together with animal characteristics, environmental data sets, including remote sensing image time series, and other bio-logged data, such as acceleration data.

[The Role of GIS in Wildlife Research](#)

Spatial databases are different from ordinary or “flat” databases because they are relational; there is a live linkage between records in the table and fea-tures in the map. Also, in spatial databases, data can be displayed in both tabular and spatial (e.g., a map) formats. In forestry, wildlife management, and agri-

The GPS tracks of the hunters were also used to create maps in ArcGIS that display the spatial distribution of hunting pressure for the study area. This study was a very clever way to link GPS data from two different sources with GIS and take advantage of GIS tools to associate these in a meaningful way.

How do we collect spatial data? Radio collars How do we collect spatial data? Direct observation and paper maps Museum records of collection locations GPS Collars/patches that upload Handheld records of indicators – scat, tracks Remotely sensed data Satellite imagery Vegetation, landcover, climate Aerial photography Radar etc.

[Spatial Database for GPS Wildlife Tracking Data](#)

ISAMUD (Integrated System for Analysis and Management of Ungulate Data) is an integrated and modular software platform developed to manage GPS collar data for wildlife management.

[Amazon.com: Spatial Database for GPS Wildlife Tracking—](#)

Based on the open source PostgreSQL/PostGIS spatial database, the software platform will allow researchers and managers to integrate and harmonize GPS tracking data together with animal characteristics, environmental data sets, including remote sensing image time series, and other bio-logged data, such as acceleration data.

[U.S. Fish and Wildlife Geospatial Services Home](#)

In this paper, we propose a new method for mapping areas of spatial-temporal overlap from wildlife tracking data. Mapping areas of spatial-temporal overlap will provide new avenues for research aimed at studying the linkages between interactive behaviour and environmental factors.

Geospatial Services. Geospatial data and services are critical elements needed to meet the mission of the U.S. Fish and Wildlife Service (USFWS). Geographic Information Systems (GIS), Global Positioning Systems (GPS), and remote sensing are the primary elements which fall under the geospatial data and services umbrella.

[Spatial Database for GPS Wildlife Tracking Data](#)

Based on the open source PostgreSQL/PostGIS spatial database, the software platform will allow researchers and managers to integrate and harmonize GPS tracking data together with animal characteristics, environmental data sets, including remote sensing image time series, and other bio-logged data, such as acceleration data.
